2. A large, horizontal disk of radius $R$, shown below, starts to rotate from rest with an angular acceleration of $\alpha$. The rotation is about a vertical axis through the centre of disk. The disk contains a narrow channel of length 2 R and rectangular cross-section. Gravity acts in the vertical direction with an acceleration of g . There is a small rectangular puck that just fits easily in the aforementioned channel, as shown. The puck is situated a distance $r$ from the axis of rotation.

## Paragraph for Questions 9 and 10

Melde's experiment has the string attached to a tuning fork. The string, driven by the tuning fork, vibrates at the fork's natural frequency. By suitably adjusting the length and tightness (or tension) of the string, we can make the string vibrate in one of its normal modes. Two different experiments can be performed with this setup. In the first, we keep the string tension constant and vary only the length of the string (remember the frequency is always that of the tuning fork). We find that for certain lengths, we get a normal mode vibration with a large amplitude. The length is held constant, and the string tension is varied in the second experiment. An easy way of doing this is to hang the end of the string over a pulley and suspend some weights from it. We again find large amplitude normal mode vibrations for certain values of the tension. The tuning fork is not located exactly at a node of the string's vibration. The reason, of course, is that the vibrating tuning fork (and attached string) has a small, but non-zero, amplitude.

9. Without changing the tuning fork, which of the following action will make string oscillate in 4 loops if initially string was oscillating as shown in the diagram :-

(B) Increasing the length to $\frac{4}{3}$ times original length
(C) Decreasing the length to $\frac{9}{16}$ times original length
(D) Submerging the hanging block in a liquid whose density is $\frac{1}{4}$ times density of block.
10. If Melde's experiment is used to find frequency of tuning fork :-
(A) Due to vibration of fork, $\mathrm{f}=\frac{\mathrm{n}}{2 \ell} \sqrt{\frac{\mathrm{~T}}{\mu}}$ gives a value which is less than true value.
(B) Due to vibration of fork, $\mathrm{f}=\frac{\mathrm{n}}{2 \ell} \sqrt{\frac{\mathrm{~T}}{\mu}}$ gives a value which is more than true value.
(C) Due to vibration of fork, $\mathrm{f}=\frac{\mathrm{n}}{2 \ell} \sqrt{\frac{\mathrm{~T}}{\mu}}$ gives a value which is exactly equal to true value.
(D) If the tension is more than a certain value, the string can not oscillate in mode of vibration as shown.

Let $P$ denotes total number of ways of selecting even number of red balls and Q denotes total number ob ways of selecting odd number of red balls.
$(2-1)(4-1)(6-1)(8-1)(10-1)=P-Q$
$(2+1)(4+1)(6+1)(8+1)(10+1)=P+Q$
Now solve to get $\mathrm{P} \& \mathrm{Q}$.
