Sol. On integrating twice by parts taking $\mathrm{e}^{-\mathrm{x}}$ as second function we have
$I_{m}=\left[-\sin ^{m} x e^{-x}\right]_{0}^{\infty}-\int_{0}^{\infty} m \sin ^{m-1} x \cos x\left(-e^{-x}\right) d x$

$$
\begin{align*}
&= 0+m \int_{0}^{\infty}\left(\sin ^{m-1} x \cos x\right) e^{-x} d x \\
&= m\left[\left\{\sin ^{m-1} x \cos x\right\}\left(-e^{-x}\right)\right]_{0}^{\infty} \\
&+m \int_{0}^{\infty}\left[(m-1) \sin ^{m-2} x \cos ^{2} x-\sin ^{m} x\right] e^{-x} d x \\
&= 0+m(m-1) \int_{0}^{\infty} \sin ^{m-2} x\left(1-\sin ^{2} x\right) e^{-x} d x \\
&= m(m-1) \int_{0}^{\infty} e^{-x} \int_{0}^{\infty} e^{-x} \sin ^{m-2} x d x \\
&-m(m-1) \int_{0}^{m} e^{-x} \sin ^{m} x d x-m \int_{0}^{\infty} e^{-x} \sin ^{m} x d x \\
& I_{m}= m(m-1) I_{m-2}-m^{2} I_{m} \quad \\
& \text { or }\left(1+m^{2}\right) I_{m}=m(m-1) I_{m-2} \quad \ldots(i)
\end{align*}
$$

To evaluate $\mathrm{I}_{4}$, put $\mathrm{m}=4,2$, successively in (i), so that
$17 \mathrm{I}_{4}=12 \mathrm{I}_{2}$ or $\mathrm{I}_{4}=\frac{12}{17} \mathrm{I}_{2}$
and $5 \mathrm{I}_{2}=2 \mathrm{I}_{0}$, i.e., $\mathrm{I}_{2}=\frac{2}{5} \mathrm{I}_{0}$
But $\mathrm{I}_{0}=\left[-\mathrm{e}^{-\mathrm{x}}\right]_{0}^{\infty}=1$
$\therefore \mathrm{I}_{4}=\frac{12}{17} \times \frac{2}{5} \times 1=\frac{24}{85}$
