$$
\begin{aligned}
& \lim _{x \rightarrow 1^{-}} f(x)=\lim _{x \rightarrow 1^{-}}(p[x+1]-q[x-1]) \\
& =p(1)-q(-1)=p+q
\end{aligned}
$$

$\lim _{x \rightarrow 1^{-}} f(x)=\lim _{x \rightarrow 1^{-}} p[x+1]-q[x-1]=2 p-q(0)=2 p$
$\because f(x)$ is continuos at $x=1$
$\therefore p+q=2 p \Rightarrow p=q \Rightarrow p-q=0$

$\mathrm{n}(\mathrm{C})=\mathrm{y}+3$
$\mathrm{n}(\mathrm{D})=\mathrm{z}$
$n(E)=z+5$
$x+y+z+x+2+y+3+z+5=40$
$x+y+z=15$ but $x \geq 1, y \geq 1$ and $z \geq 1$ So total ways of distribution si ${ }^{14} \mathrm{C}_{2}=91$

For the line to be co-planar
$\overrightarrow{\mathrm{AB}}, \overrightarrow{\mathrm{a}}$ and $\overrightarrow{\mathrm{b}}$ should be co-planar
$\left|\begin{array}{ccc}2 & 0 & \mathrm{k} \\ 1 & \mathrm{k} & -2 \\ 4 & 1 & -1-\mathrm{k}\end{array}\right|=0$
$\Rightarrow 2\left(-\mathrm{k}-\mathrm{k}^{2}+2\right)+\mathrm{k}(1-4 \mathrm{k})=0$
$-2 \mathrm{k}-2 \mathrm{k}^{2}+4+\mathrm{k}-4 \mathrm{k}^{2}=0$
$-6 \mathrm{k}^{2}-\mathrm{k}+4=0$
$6 \mathrm{k}^{2}+\mathrm{k}-4=0$
This equatiion has two distinct roots So two such planes exist.

$\mathrm{Y}^{2}=2\left(\mathrm{x}-\frac{1}{2}\right)$
$C_{2}: \arg (z-(-1-i)=\alpha$
It's a ray emanating from $(-1,-1)$ and making angle $\alpha$ with the positive real axis $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$ have exactly one point common
$\mathrm{C}_{2}$ must be tangent to $\mathrm{C}_{1}$
$y+1=m(x+1)$

Suppose $a-d$, $a, a+d$ are roots of the given equation
$\therefore \quad a-d+a+a+d=6$
$\Rightarrow \mathrm{a}=2$
$\Rightarrow$ roots are $2-\mathrm{d}, 2,2 \mathrm{~d}$ are the roots and
2. $(2-\mathrm{d})+2 .(2+\mathrm{d})+2-\mathrm{d})(2+\mathrm{d})=\beta_{1}$
$\Rightarrow \mathrm{d}=\sqrt{12-\beta_{1}}$
$\Rightarrow \beta_{1}=12-\mathrm{d}^{2}$ and $2(2-\mathrm{d})(2-\mathrm{d})=\beta_{2}$
$\Rightarrow \beta_{2}=8-2 d^{2}$
Hence $\beta_{1}+\beta_{2}=20-3 d^{2}$
$\left(\beta_{1}+\beta_{2}\right)_{\max }=17$ when $\mathrm{d}=1$
13. Ans. (3)

As $2 \alpha^{2}, \alpha^{4}, 24$ are in AP
So, $2 \alpha^{4}=2 \alpha^{2}+24 \Rightarrow \alpha^{4}-\alpha^{2}-12=0$
$\Rightarrow\left(\alpha^{2}-4\right)-\left(\alpha^{2}+3\right)=0$
$\therefore \alpha= \pm 2$ (As $\alpha^{2}+3 \neq 0$ for any real $\alpha$ )
Also, $1, \beta^{2}, 6-\beta^{2}$ are in G. P
So, $\beta^{4}=1\left(6-\beta^{2}\right) \Rightarrow \beta^{4}+\beta^{2}-6=0$
$\Rightarrow\left(\beta^{2}+3\right)\left(\beta^{2}-2\right)=0 \Rightarrow \beta= \pm \sqrt{2}$
(As $\beta^{2}+3 \neq 0$ for any real $\beta$ )
Hence, $\alpha_{1}^{2}+\alpha_{2}^{2}+\beta_{1}^{2}+\beta_{2}^{2}=12$
14. Ans. (4)

Let $\alpha$ be a root of $f(x)=0$
$\therefore \mathrm{f}(\alpha)=0$ and $\mathrm{f}(\mathrm{f}(\alpha))=0$
$\Rightarrow \mathrm{f}(0)=0 \Rightarrow \mathrm{~b}=0$
$\therefore \mathrm{f}(\mathrm{x})=\mathrm{x}(\mathrm{x}+\mathrm{a})=0 \Rightarrow \mathrm{x}=0$ or $\mathrm{x}=-\mathrm{a}$
$f(f(x))=x(x+a)\left(x^{2}+a x+a\right)=0$
$\therefore \mathrm{x}^{2}+\mathrm{ax}+\mathrm{a}=0$ should have no real roots besides
0 and $-\mathrm{a} \quad \mathrm{D}=\mathrm{a}^{2}-4 \mathrm{a}<0 \Rightarrow 0<\mathrm{a}<4$

If the roots of $x^{2}+a x+a=0$ is either $x=0$
or $\mathrm{x}=-\mathrm{a}$ then $\mathrm{a}=0$
$\therefore \alpha \in[0,4) \Rightarrow a=0,1,2,3$
Number of ordered pairs $=4$

inequation $\left(x^{2}+1\right)>0$ is satisfies $\forall x \in R$
Hence the inequations

$\Rightarrow(a-1) x^{2}-(a+|a-1|+2) x+a+1 \geq 0 \quad \forall x \in R$
So, $(a-1)>0$ and
$\mathrm{D} \leq 0 \Rightarrow(\mathrm{a}+|\mathrm{a}-1|+2)^{2}-4(\mathrm{a}-1) \leq 0$
(As $\mathrm{a}>1 \Rightarrow|\mathrm{a}-1|=\mathrm{a}-1$ )
$\Rightarrow 4 \mathrm{a}^{2}+5 \leq 0$ which is not possible for any real values of 'a'
Hence no such real 'a' exists

$n_{1}+n_{2}+n_{3}+n_{4}=51$
giving $n_{1}, n_{2}, n_{3}, n_{4}$ each equal to 1
We have $n_{1}+n_{2}+n_{3}+n_{4}=47$
using beggar $\underbrace{00 \ldots \ldots .0}_{47} \underbrace{\emptyset \emptyset \emptyset}_{3}$

$g(x) \Rightarrow-x^{2}-2 c x+b^{2}$
$\Rightarrow-(x+c)^{2}+c^{2}+b^{2}$
$\Rightarrow\left(b^{2}+c^{2}\right)-(x+c)^{2} \leq\left(b^{2}+c^{2}\right)$
$g(x)_{\text {max }}=b^{2}+c^{2}$

At point $\left(\frac{-5}{\sqrt{2}}, \frac{3}{\sqrt{2}}\right)$
$-\frac{d x}{d y}=-\frac{5}{3}=m_{2}$

Equation of the tangent at the vertex is $x-y+1=0$

Equation of the axis of the parabola is $x+y+k=0$
...(ii) Since it passes through $(0,0)$
$0+0+k=0$

$\therefore$ Equation of axis is $x+y=0$

Where z is a point on directrix
Solving (i) and (iii) we get $A\left(\frac{-1}{2}, \frac{1}{2}\right)$

Sol. Newton's second law gives
$N+M g \cos \theta=\frac{m v^{2}}{R}$
Conservation of mechanical energy gives
$\frac{1}{2} m v^{2}=m g R(1-\cos \theta) \Rightarrow v^{2}=2 g R(1-\cos \theta)$
$N=\frac{m v^{2}}{R}-m g \cos \theta=m g(2-3 \cos \theta)$
Also $2 N \cos \theta=M g \Rightarrow 2 m g(2-3 \cos \theta) \cos \theta=M g$
Maximum value of upward force can be achieved by $\frac{d}{d \theta}(2-3 \cos \theta) \cos \theta=0$
$\Rightarrow \sin \theta=0$ or $\cos \theta=\frac{1}{3}$
So $2 m g(2-1) \frac{1}{3}=M g, \frac{2}{3} m=M$

Sol. As electric field and gravitational fields are conservative the work done by them in any closed loop must be zero.

Lets make a charge $\mathrm{q}_{0}$ move along a square loop abcd as shown.

The work done along bc and da will be zero as $\theta=90^{\circ}$. But the net work done is not zero as strength of $\vec{E}$ along ab and cd are different. So these lines cannot qualify as electric or gravitational field lines not even non-uniform.

$\lambda_{\mathrm{m}}^{\infty}$ for $\mathrm{CH}_{3} \mathrm{COOH}=91+421.5-126=386.5$
$\lambda_{\mathrm{m}}^{\infty}=\frac{\frac{1}{\mathrm{R}}\left(\frac{\ell}{\mathrm{a}}\right) \times 1000}{\text { Molarity }}=\frac{\frac{1}{520} \times(2.01) \times 1000}{0.1}$
